Executive One-Pager — DIS Group × Skyscanner

DIS Group at a Glance

Company	DIS Group
Headquarters	Ireland (EU-incorporated)
Type	AI-native technology company
Stage	Pre-launch — architecture complete, build in progress
Products	DIS Travel · DIS Energy Intelligence · DIS ESG Platform
AI approach	AI-native from inception; governance-first deployment

Data compliance	GDPR-compliant by design; EU data residency capability
Operational foundation	Three active businesses (recycling, energy, ESG data) — providing financial base and multi-domain AI deployment track record

---

DIS Travel — The Product

DIS Travel is an AI-powered Travel Intelligence Platform for corporate travel buyers and travel-intensive organisations.

Where traditional corporate travel management platforms focus on booking and expense processing, DIS Travel focuses on intelligence: giving organisations the analytical capability to understand, optimise, and act on their travel programmes as a strategic function — not an administrative one.

Core Capability Areas

Capability	Description
Travel Policy Intelligence	**AI-assisted policy compliance monitoring, exception analysis, and spend pattern recognition — at the time of booking, not after**
Destination Intelligence	**Risk assessment, visa requirements, health advisories, and local context — synthesised by AI and surfaced at decision time**

Carbon & ESG Tracking	**Route-level Scope 3 carbon attribution using ICAO/GHG Protocol methodologies, integrated with organisational ESG reporting infrastructure**
Market Intelligence	**Pricing trend analysis, optimal booking window identification, and forward-looking availability intelligence**
Supplier Analytics	**Carrier and accommodation performance benchmarking across an organisation's historical travel programme**

What DIS Travel Is Not

DIS Travel is not a booking platform. It is not a consumer search product. It is not a travel management company (TMC). It does not replace these systems — it sits above them and makes them more valuable by adding the intelligence layer that none of them provide.

The Problem DIS Travel Solves

Most organisations have reasonable booking infrastructure and poor travel intelligence. Spend is reconciled retrospectively. Policy compliance is inconsistently enforced. Carbon impact is estimated annually from expense data using industry averages. Supplier performance is tracked in spreadsheets, if at all.

The EU Corporate Sustainability Reporting Directive (CSRD), now in force, mandates Scope 3 reporting for tens of thousands of in-scope organisations across Europe. Business travel is a primary Scope 3 category. For the first time, accurate carbon measurement is not a sustainability aspiration — it is a compliance requirement with audit implications.

DIS Travel is designed for this environment: organisations that need travel intelligence that is accurate, audit-ready, and integrated with their existing reporting infrastructure.

Competitive Context — Why Existing Platforms Do Not Solve This

Navan, SAP Concur, TravelPerk, and Spotnana have all introduced sustainability, policy, and intelligence features in the last three years. These are real products from well-capitalised companies. DIS Group is aware of them.

The constraint is architectural, not commercial:

Existing Platform Type	Architectural Limitation
Booking platforms with intelligence added	**Data model optimised for booking volume — intelligence is a secondary output**

Carbon tracking from expense data	**Average emissions factors applied to spend categories — does not meet ICAO methodology**
Rule-based policy compliance	**Static rule-matching — cannot reason about context or exceptions at booking time**
US-architected platforms	**CSRD is an EU directive with EU data residency expectations; not a core design constraint for US-first products**

DIS Travel is built as an intelligence platform that integrates with booking systems — not as a booking platform that has added intelligence. That distinction is architectural, not cosmetic. It determines what CSRD-compliant methodology is achievable and why the Skyscanner data partnership is structurally necessary.

Why This Requires a Partner Like Skyscanner

DIS Travel's intelligence is only as good as the travel content data it is built on. We have evaluated the data landscape carefully. Skyscanner's value for DIS Travel is specific:

- **Route and carrier metadata depth** — the granularity of scheduled and operational route data available through Skyscanner's partner programme is required for accurate per-trip carbon calculation
- **European coverage** — Skyscanner's strength in European routes aligns with DIS Travel's initial market
- **B2B partner ecosystem** — Skyscanner has an established infrastructure for partner data relationships that most travel data sources do not
- **Real-time pricing signals** — live market pricing is the foundation of DIS Travel's market intelligence capability

We are not seeking a generic data feed. We are building a structural data partnership — one where Skyscanner's content is the foundation layer of DIS Travel's intelligence, and where DIS Travel's corporate intelligence creates an enterprise channel that Skyscanner's consumer platform does not directly reach.

The Partnership Thesis

DIS Group Brings	Skyscanner Brings
AI-native travel intelligence architecture	**Structured route, carrier, and pricing data at partner API depth**

Corporate market access — B2B, not B2C	**Real-time availability and pricing signals**
Route-level Scope 3 carbon intelligence	**European route coverage aligned with DIS Travel's launch market**
GDPR-compliant EU data architecture	**An established B2B partner programme**
Long-term build commitment with documented roadmap	**A trusted brand that enterprise buyers already recognise**

The combination is complementary, not competitive. Skyscanner serves travellers and the platforms that serve them. DIS Travel serves the organisations that employ those travellers — a different buyer, a different decision cycle, and a different value proposition.

Our Current Build Status

Architecture is complete and published. AI governance framework is documented and operational (governing our internal AI Architect today). Foundation infrastructure is in build. First intelligence components are targeted for Q1 2027 — with enterprise pilot readiness at Q2–Q3 2027.

We are approaching Skyscanner at this stage deliberately. The integration architecture is designed to accommodate Skyscanner's data structure from day one — not retrofitted at a later stage.

Risk Calibration — What We Are Asking Skyscanner to Commit

Stage	What Skyscanner Commits	What Skyscanner Receives
Initial conversation (45 min)	**One meeting — no commercial, technical, or data commitment**	**A structured assessment of whether the strategic fit warrants further investment**
Partnership design (60–90 days)	**Dedicated time from partnerships and technical teams**	**A fully specified commercial proposal, technical integration design, and data agreement draft**
Integration build	**Defined data access under signed agreement**	**A corporate buyer channel and CSRD-driven distribution that Skyscanner's consumer product does not currently reach**

The initial ask is a conversation. Not a pilot. Not a data access agreement. Not a commercial commitment.

What We Are Proposing

A 45-minute leadership conversation to explore:

1. Whether the strategic fit justifies a partnership design process
2. What the data and technical integration would look like in practice
3. What the commercial structure of a long-term partnership might be
4. What the mutual value creation timeline looks like on both sides
