

DIS GROUP

The Intelligence Layer
for Corporate Travel

Introducing DIS Travel

PREPARED FOR

Skyscanner

Partnerships Team

PARTNERSHIP PACKAGE CONTENTS

- 01. Cover Letter
 - 02. Executive One-Pager
 - 03. Company & Product Presentation (this document)
 - 04. Technical Architecture Overview
-

July 2026 | Confidential — For Partnership Discussion Only

One thesis applied across three markets: build the intelligence layer for industries that make decisions with poor data.

DIS TRAVEL

AI-powered Travel Intelligence Platform

Intelligence layer for corporate buyers and travel-intensive organisations. Built for CSRD compliance from the foundation.

DIS ENERGY

Trading and Asset Decision Intelligence

Intelligence layer for energy market decisions, asset portfolio management, and regulatory positioning.

DIS ESG

Environmental and Governance Data

Structured ESG data infrastructure for corporate compliance, CSRD reporting, and capital markets disclosure.

WHAT EVERY DIS PRODUCT SHARES

- AI-native from inception — no legacy architecture to retrofit
- GDPR-compliant design — EU-incorporated company, EU enterprise market
- Governance-first AI deployment — published frameworks, operational today
- Data treated as a strategic asset: owned, structured, and governed
- Long-term horizon — built for defensible positions, not first-version launches

HOW DECISIONS ARE MADE TODAY

- 01 Policy set as a static document
- 02 Travellers book — often on consumer tools, outside policy
- 03 Finance reconciles spend after the fact
- 04 Carbon estimated annually from expense data, using averages
- 05 No real-time view of compliance or ESG alignment

- Policy compliance**
Assessed at booking time — not reconciled after the fact
- Carbon attribution**
Per-trip, route-level, using ICAO aircraft-type methodology
- Pricing context**
Historical and forward patterns surfaced at decision time
- Destination intelligence**
Risk, visa, and advisory data synthesised in real time
- Programme analytics**
Continuous visibility — not an annual report

The opportunity is not to build a better booking tool. It is to build the intelligence infrastructure that makes every corporate travel decision better.

The gap is not from lack of trying. Navan, SAP Concur, TravelPerk, and Spotnana have all introduced intelligence features. The constraint is architectural, not commercial.

Platform	Design Priority	Intelligence Limitation
Navan	Booking and expense consolidation	Carbon tracking from spend categories. ICAO-level aircraft methodology not achievable from a booking-first data model.
SAP Concur	ERP integration and expense management	Sustainability module uses average industry factors. Policy compliance is rule-based matching, not AI reasoning.
TravelPerk	SME booking experience	Intelligence features are extensions to the booking workflow. Not designed for CSRD audit readiness.
Spotnana	Modern booking infrastructure	Platform layer. Intelligence is a third-party integration problem, not a core product capability.

DIS Travel is an intelligence platform that integrates with booking systems — not a booking platform with intelligence added. The architectural starting point determines what CSRD-compliant methodology is achievable.

This architectural distinction is why the Skyscanner data partnership is structurally necessary, not interchangeable with other data sources.

An AI-Powered Travel Intelligence Platform for corporate buyers and travel-intensive organisations.

WHAT DIS TRAVEL IS NOT

- ✗ Not a booking platform — does not compete with GDSs or OBTs
- ✗ Not a consumer product — built exclusively for enterprise buyers
- ✗ Not a TMC — does not replace the TMC relationship
- ✗ Not an expense tool — designed to integrate with Concur, SAP, etc.

These are architectural choices with specific commercial consequences — not positioning claims.

01

Intelligence Separable from Booking

The intelligence layer operates independently of any specific booking system. DIS Travel integrates with an organisation's existing booking tool — it does not require replacing it. This removes the booking displacement objection from enterprise procurement entirely.

02

Carbon as a First-Class Data Type

Carbon attribution is calculated at trip-creation time, stored with full ICAO methodology provenance (inputs, methodology version, aircraft type, output), and queryable at any aggregation level. It is not a dashboard generated from expense exports — a distinction that CSRD audit readiness requires.

03

GDPR as a Data Model Constraint

Data minimisation and purpose limitation are enforced at the schema level — traveller PII is absent from the intelligence layer because the data model does not collect it there. This eliminates a class of compliance risk rather than managing it with policy documents.

04

Governance-First AI Deployment

AI components are not shipped until pre-deployment review is complete, risk class is assigned (Class 1–4 framework), and audit logging is confirmed. This adds deployment time. It is the correct tradeoff for a platform that enterprise procurement teams will scrutinise.

WHY CSRD REQUIRES TRAVEL

- In force from 2024**
Phased scope expansion through 2026
- Business travel = Scope 3 Category 6**
Mandatory measurement — estimation is insufficient
- Audit-defensible methodology required**
ICAO or equivalent standard expected by auditors
- Per-trip reporting capability**
Spend-category averages no longer adequate
- Tens of thousands of in-scope organisations**
Across the EU by full rollout

Dimension	Today	DIS Travel
Timing	Annual, retrospective	Real-time, per booking
Methodology	Spend averages	ICAO aircraft-type
Granularity	Category level	Route + carrier level
Audit readiness	Estimated	Methodology-logged
Reporting	Manual export	Direct Scope 3 flow

The accuracy of DIS Travel's carbon capability depends on route-level aircraft-type data — the specific data dependency that makes the Skyscanner partnership architecturally necessary.

DIS Travel is positioned as the first platform to make CSRD-compliant travel intelligence architecturally achievable — a narrow, specific, and defensible position.

01	02	03
CSRD Compliance Is Active and Urgent	AI Infrastructure Has Reached Enterprise Viability	Corporate Travel Buyers Are Redefining Requirements
The EU Corporate Sustainability Reporting Directive is in force. Companies in scope are actively building Scope 3 measurement infrastructure. Business travel is a primary category. Compliance deadlines create procurement budget and urgency that did not exist two years ago.	The large language models, data pipelines, and inference infrastructure that DIS Travel requires are now commercially available at the cost, latency, and reliability thresholds that enterprise software demands. Building this was technically possible but economically marginal three years ago.	Corporate travel budgets have returned to pre-2020 levels — but the conversations around them have changed. CFOs are asking about ESG alignment. Procurement teams are asking about audit readiness. Sustainability teams are asking about Scope 3 methodology. The tool set has not kept pace.

We have evaluated the data landscape carefully. Skyscanner's value to DIS Travel is specific, not generic.

What DIS Travel Requires	Why Skyscanner — Specifically
Route-level aircraft metadata	Required for ICAO/GHG Protocol carbon attribution. Available at depth through Skyscanner's partner programme in a way consumer-facing sources do not provide.
European route coverage	Skyscanner's depth in European routes aligns with DIS Travel's launch market. Accuracy across these routes is critical for initial enterprise customers.
Structured B2B partner infrastructure	Skyscanner has built a partner programme with the data contracts, SLAs, and API design that enterprise integrations require. Reduces integration risk for both parties.
Real-time pricing signals	Market intelligence requires live data. Skyscanner's real-time pricing infrastructure is the signal layer that makes booking-window recommendations actionable.

WHAT DIS TRAVEL BRINGS TO SKYSCANNER

- Access to corporate buyers — a B2B market Skyscanner's consumer product does not directly serve
 - Long-term architectural investment — Skyscanner as the foundation data layer for a decade-horizon platform
- CSRD-driven demand: enterprise buyers with compliance obligations and dedicated budget for intelligence tools
 - Distribution: when DIS Travel identifies the optimal option, the booking connects to Skyscanner's supplier network

Skyscanner serves travellers. DIS Travel serves the organisations that employ them. The relationship is complementary, not competitive.

01 DATA FOUNDATION

Structured access to Skyscanner's travel content as the foundation layer for DIS Travel's intelligence:

- Route and schedule data
- Real-time pricing and availability
- Aircraft type per route (ICAO carbon)
- Historical fare patterns

02 DISTRIBUTION ALIGNMENT

When DIS Travel intelligence drives a booking decision, the booking connects to Skyscanner's supplier network.

Corporate bookings via intelligence tools represent high-intent, context-rich transactions — distinct from consumer metasearch traffic.

03 CARBON DATA COLLABORATION

Co-development of route-level carbon intelligence anchored in Skyscanner's route and aircraft data, validated against ICAO/GHG Protocol methodology.

Neither organisation can build this at the same accuracy independently.

INDICATIVE PARTNERSHIP TIMELINE

Phase	Period	Milestone
Exploratory	Q3–Q4 2026	Leadership and technical conversations; assess strategic fit
Partnership Design	Q4 2026 – Q1 2027	Commercial structure, data agreement, technical specification
Integration Build	Q1–Q2 2027	Data connection, integration testing, quality assurance
Enterprise Pilot	Q2–Q3 2027	First enterprise pilots with DIS Travel + Skyscanner content
Scale	2027–2028	Expand enterprise accounts; deepen integration

Timeline is indicative — subject to partnership discussion. We are not proposing Skyscanner commit to anything before the strategic fit is established.

The question enterprise partners ask is not whether the product idea is interesting. It is whether the team behind it can execute.

OPERATING FOUNDATION

DIS Group is not a startup built around a founding pitch.

We operate three businesses today — in recycling operations, energy trading intelligence, and ESG data infrastructure.

The governance frameworks and technology standards governing DIS Travel are adapted from frameworks operational in those businesses.

DIS Travel is the application of a proven development discipline to a new market — not a first attempt at building something complex.

GOVERNANCE YOU CAN AUDIT

Our technology governance is operational today:

- AI governance policy — four-class risk classification, pre-deployment review, incident response
- Architecture decisions via ADRs — documented rationale for every major choice
- GDPR compliance — EU-incorporated, EU data residency capability, enterprise DPA-ready
- Published documentation — available to share, not just to describe

TRANSPARENCY AS PRACTICE

Every document in this package is honest about where we are.

Our development status table shows clearly what is complete, in progress, and designed-but-not-built.

We do not claim customers we do not have or revenues we have not earned.

The most enduring technology partnerships are built on accurate mutual understanding — and that is the basis on which we are approaching this conversation.

What we are asking for is a conversation. Not a pilot. Not a data access agreement. Not a commercial commitment.

WHAT SKYSCANNER COMMITS AT EACH STAGE

Stage	Skyscanner Commits	Skyscanner Receives
Initial conversation (45 minutes)	One meeting No commercial or data commitment	A structured assessment of whether strategic fit warrants further investment
Partnership design (60–90 days)	Dedicated time from partnerships and technical teams	Fully specified commercial proposal, technical integration design, and data agreement draft
Integration build	Defined data access under signed agreement	Corporate buyer channel and CSRD-driven distribution Skyscanner's consumer product does not currently reach

WHAT WE BRING TO THE INITIAL CONVERSATION

Technical depth	Commercial clarity	Honesty about timelines
Architecture walkthrough and specific data dependencies	Value exchange articulated precisely; open to Skyscanner's preferred commercial structure	We will not overstate build progress or compress realistic partnership timelines

Proposed next step: a 45-minute call at a time that suits your team. Contact: [ceo@disgroup.ie]
